Physically boardgame Example game step by step

🟫 SCRUM GAME

Original Physical Version – Rulebook

---

1. What do you see on the table?

(Board overview example)

1.1 The game board

The board consists of:

7 products [default value], each containing **4 sprints** [default value].

Each sprint has:

- **Features** → square blocks ■
- **Value** → rings ○ (1 ring = €5,000 [default value])

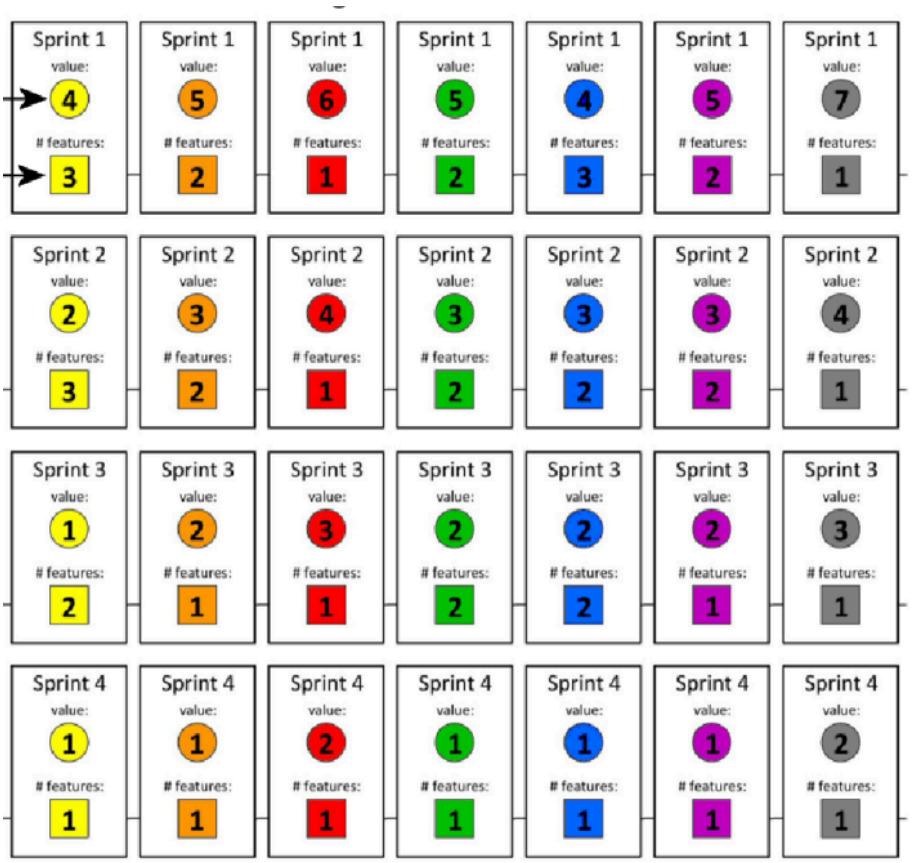
Generic product example

```
None
Sprint 1: [■ ■ ■]   ○ ○ ○
Sprint 2: [■ ■ ■]   ○ ○
Sprint 3: [■ ■]     ○
Sprint 4: [■]       ○
```

1.2 Products on the board

```
None
🟨 Yellow    🟦 Blue    🟥 Red
🟧 Orange    🟩 Green   🟪 Purple
⬛ Black
```

Each product color has its **own fixed sprint structure**
(number of features and value rings as printed on the board).



The board value and features setup are [default value] for the boardgame.

1.3 Players and components

Each player receives:

- 1 pawn [A]
- 6 [default value] black sprint tokens [redacted]
- €25,000 [default value] starting money

Additionally:

- **Refinement cards** (1 shuffled deck)
- **Incident cards** (1 shuffled deck)
- Dice:
  - white **D20 [x1]**
  - black **D10 [x2]**
  - black **D6 [x3]**
- The bank (unlimited money)

---

2. Setup

1. Each player receives:
    - €25,000 [default value]
    - 6 sprint tokens [default value]
    - 1 pawn
2. Each player:
    - chooses **one product color**
    - places their pawn on the **Start field** of that product
3. Shuffle:
    - Refinement cards
    - Incident cards
4. Place both decks **face down** next to the board.

---

3. Objective of the game

> Accumulate **more money than the other players**
> by developing products within **6 sprints** [default value].

---

4. Game flow (high level)

- The game is played in **rounds**
- In each round, **every player takes exactly one turn**
- One turn = **one complete sprint**
- After each round:
    - **exactly one Incident card** is resolved
- After **6 sprints** [default value] **per player**, the game ends

---

5. Playing a turn (step by step)

Overview

Each turn consists of **4 fixed steps**:

```
None
1. Choose product / switch
2. Play 5 Daily Scrums
3. Pay & receive money
4. Refinement + Incident
```

5.1 Step 1 — Product choice & switching

At the start of your turn:

- remove **1 sprint token**

Then choose:

A. Continue with the same product

- Move to the **next sprint**
- Cost: **€0** [default value]

B. Switch to another product

- Pay **€5,000** [default value]
- Place your pawn on **Sprint 1** of another product
- Continue there

C. Product completed (Sprint 4 finished)

- You may switch to a new product **for free** [default value]
- Start there at Sprint 1

5.2 Step 2 — The 5 Daily Scrums

Each sprint always has **exactly 5** [default value] **Daily Scrums**.

Which dice do you use?

Depending on the **number of features** in that sprint:

Features	Dice
1	1× D20
2	2× D10
3	3× D6
4	3× D6

How a Daily Scrum works

- Roll the dice
- Add up the result
- Compare it to **12** [default value]
- Record the difference:
  - above 12 [default value]→ +
  - below 12[default value] → −

Repeat this **5** [default value] **times**.

5.3 Step 3 — Sprint outcome & money

After 5 [default value] scrums, sum everything → **net result**.

Situation A — Net = 0

```
None
✔ Sprint successful
Payout: rings × €5,000 [default value]
```

Situation B — Net negative (e.g. −1)

```
None
✔ Sprint successful
Payout: (rings × €5,000[default value]) − (€1,000 [default value] ×
|negative|)
```

Situation C — Net positive (e.g. +1)

```
None
✖ Sprint failed
Payout: − (€1,000 [default value] × positive)
```

> **Important:**
> Only when net ≤ 0 does a sprint deliver value.

5.4 Mandatory loans

- If you cannot pay a required amount:
  → you **must** borrow €50,000 [default value]
- Interest: **€5,000** [default value] **per following turn**
- Voluntary loans are **not allowed**

5.5 Step 4 — Refinement

- Draw **1 refinement card**
- Roll **1× D20**
- Apply the effect **exactly as written**
- Effects are **product-wide**
- Only affect **future sprints**

---

6. Incidents (after each round)

Once **all players** are on the Incident field:

1. Draw **1 Incident card**
2. Apply the effect **globally**
3. Incidents affect:
    - sprint value (rings)
    - never features

---

7. End of the game

- When **all players have completed 6** [default value] **sprints**
- Count all money
- The player with the **most money wins**

---

8. One-page summary

```
None
✔ 6 sprints per player
✔ 1 sprint per turn
✔ 5 daily scrums per sprint
✔ Net zero or negative = value
✔ Positive = no value + penalty
✔ Switch = €5,000
✔ Incident after each round
```

---

9. What this game is meant to make you feel

Without explicitly stating it, the game lets you experience:

- focus vs. chaos
- short-term vs. long-term thinking
- value ≠ activity
- the risk of switching
- the impact of external events
